## Assignment Project Exam Help

1

## Chapter 2 Application Layer

### A note on the use of these PowerPoint slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you see the animations; and can add, modify, and delete slides (including this one) and slide content to suit your needs. They do not represent a lot of work on our part. In return for use, we only ask the following:

- If you use these slides (e.g., in a class) that you mention their source (after all, we'd like people to use our book)
- If you post any slides on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoyed! JFJKWR

 Application Layer

2-2

2

<https://powcoder.com>

### Application layer: overview

- Principles of network applications
- Web and HTTP
- E-mail, SMTP, IMAP
- The Domain Name System DNS

- P2P applications
- video streaming and content distribution networks
- socket programming with UDP and TCP

Application Layer: 2-3

## Add WeChat powcoder

### Application layer: overview

#### Our goals:

- conceptual *and* implementation aspects of application-layer protocols
  - transport-layer service models
  - client-server paradigm
  - peer-to-peer paradigm
- learn about protocols by examining popular application-layer protocols and infrastructure
  - HTTP
  - SMTP, IMAP
  - DNS
  - video streaming systems, CDNs
- programming network applications
  - socket API

Application Layer: 2-4

3

4

### Some network apps

- social networking
- Web
- text messaging
- e-mail
- multi-user network games
- streaming stored video (YouTube, Hulu, Netflix)
- P2P file sharing
- voice over IP (e.g., Skype)
- real-time video conferencing (e.g., Zoom)
- Internet search
- remote login
- ...

*Q: your favorites?*

### Creating a network app

**write programs that:**

- run on (different) end systems
- communicate over network
- e.g., web server software communicates with browser software

**no need to write software for network-core devices**

- network-core devices do not run user applications
- applications on end systems allows for rapid app development iteration

Application Layer: 2-5

Application Layer: 2-6

5

6

# Assignment Project Exam Help

### Client-server paradigm

**server:**

- always-on host
- permanent IP address
- often in data centers, for scaling

**clients:**

- contact, communicate with server
- may be intermittently connected
- may have dynamic IP addresses
- do not communicate directly with each other
- examples: HTTP, IMAP, FTP

mobile network

home network

local or regional ISP

content provider network

datacenter network

Application Layer: 2-7

### Add WeChat powcoder

### Peer-peer architecture

**no always-on server**

- arbitrary end systems directly communicate
- peers request service from other peers, provide service in return to other peers
  - *self scalability* – new peers bring new service capacity, as well as new service demands
- peers are intermittently connected and change IP addresses
  - complex management
- example: P2P file sharing

mobile network

home network

local or regional ISP

content provider network

datacenter network

Application Layer: 2-8

7

8

### Processes communicating

**process:** program running within a host

- within same host, two processes communicate using **inter-process communication** (defined by OS)
- processes in different hosts communicate by exchanging messages

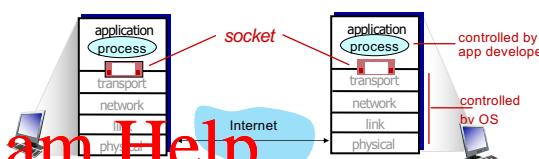

**clients, servers**

**client process:** process that initiates communication  
**server process:** process that waits to be contacted

- note: applications with P2P architectures have client processes & server processes

### Sockets

- process sends/receives messages to/from its **socket**
- socket analogous to door
  - sending process shoves message out door
  - sending process relies on transport infrastructure on other side of door to deliver message to socket at receiving process
- two sockets involved: one on each side

Assignment Project Exam Help

Application Layer: 2-9

Application Layer: 2-10

9

10

<https://powcoder.com>

### Addressing processes

- to receive messages, process must have **identifier**
- host device has unique 32-bit IP address
- Q:** does IP address of host on which process runs suffice for identifying the process?
  - A:** no, many processes can be running on same host

### Add WeChat powcoder

An application-layer protocol defines:

- types of messages exchanged,**
  - e.g., request, response
- message syntax:**
  - what fields in messages & how fields are delineated
- message semantics**
  - meaning of information in fields
- rules** for when and how processes send & respond to messages

Application Layer: 2-11

Application Layer: 2-12

11

12

What transport service does an app need?			
<b>data integrity</b>	<b>throughput</b>		
▪ some apps (e.g., file transfer, web transactions) require 100% reliable data transfer	▪ some apps (e.g., multimedia) require minimum amount of throughput to be “effective”		
▪ other apps (e.g., audio) can tolerate some loss	▪ other apps (“elastic apps”) make use of whatever throughput they get		
<b>timing</b>	<b>security</b>		
▪ some apps (e.g., Internet telephony, interactive games) require low delay to be “effective”	▪ encryption, data integrity,		

**Assignment Project Exam Help**

Application Layer: 2-13

13

Transport service requirements: common apps			
application	data loss	throughput	time sensitive?
file transfer/download	no loss	elastic	no
e-mail	no loss	elastic	no
Web documents	no loss	elastic	no
real-time audio/video	loss-tolerant	audio: 5Kbps-1Mbps video:10Kbps-5Mbps	yes, 10's msec
streaming audio/video	loss-tolerant	same as above	yes, few secs
interactive games	loss-tolerant	Kbps+ ext message loss no loss	yes, 10's msec
		elastic	yes and no

Application Layer: 2-14

14

<https://powcoder.com>

Internet transport protocols services		
application	layer protocol	transport protocol
TCP service:		
▪ <b>reliable transport</b> between sending and receiving process		
▪ <b>flow control</b> : sender won't overwhelm receiver		
▪ <b>congestion control</b> : throttle sender when network overloaded		
▪ <b>connection-oriented</b> : setup required between client and server processes		
▪ <b>does not provide</b> : timing, minimum throughput guarantee, security		
UDP service:		
▪ <b>unreliable data transfer</b> between sending and receiving process		
▪ <b>does not provide</b> : reliability, flow control, congestion control, timing, throughput guarantee, security, or connection setup.		
Q: why bother? Why is there a UDP?

19

20

### HTTP overview (continued)

**HTTP uses TCP:**

- client initiates TCP connection (creates socket) to server, port 80
- server accepts TCP connection from client
- HTTP messages (application-layer protocol messages) exchanged between browser (HTTP client) and Web server (HTTP server)
- TCP connection closed

**HTTP is “stateless”**

- server maintains *no* information about past client requests

*aside*

**protocols that maintain “state” are complex!**

- past history (state) must be maintained
- if server/client crashes, their views of “state” may be inconsistent
- is state lost?

Application Layer: 2-21

### HTTP connections: two types

**Non-persistent HTTP**

1. TCP connection opened
2. at most one object sent over TCP connection
3. TCP connection closed

downloading multiple objects required multiple connections

**Persistent HTTP**

- TCP connection opened to a server
- multiple objects can be sent over *single* TCP connection between client, and that server
- TCP connection closed

Application Layer: 2-22

21

22

# Assignment Project Exam Help

### Non-persistent HTTP: example

User enters URL: `www.someSchool.edu/someDepartment/home.index` (containing text, references to 10 jpeg images)

The diagram illustrates the sequence of events in non-persistent HTTP:

- 1a. HTTP client initiates TCP connection to HTTP server (process) at `www.someSchool.edu` on port 80.
- 1b. HTTP server at host `www.someSchool.edu` waiting for TCP connection at port 80 “accepts” connection, notifying client.
2. HTTP client sends HTTP *request message* (containing URL) into TCP connection socket. Message indicates that client wants object `someDepartment/home.index`.
3. HTTP server receives request message, forms *response message* containing requested object, and sends message into its socket.

Application Layer: 2-23

### Non-persistent HTTP: example (cont.)

User enters URL: `www.someSchool.edu/someDepartment/home.index` (containing text, references to 10 jpeg images)

The diagram continues the sequence of events:

5. HTTP client receives response message containing html file, displays html. Parsing html file, finds 10 referenced jpeg objects.
6. Steps 1-5 repeated for each of 10 jpeg objects.
4. HTTP server closes TCP connection.

Application Layer: 2-24

23

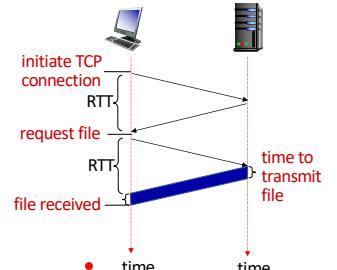

24

### Non-persistent HTTP: response time

**RTT (definition):** time for a small packet to travel from client to server and back

**HTTP response time (per object):**

- one RTT to initiate TCP connection
- one RTT for HTTP request and first few bytes of HTTP response to return
- object/file transmission time

Non-persistent HTTP response time =  $2 \times RTT + \text{time to transmit file}$

Application Layer: 2-25

### Persistent HTTP (HTTP 1.1)

**Non-persistent HTTP issues:**

- requires 2 RTTs per object
- OS overhead for *each* TCP connection
- browsers often open multiple parallel TCP connections to fetch referenced objects in parallel

**Persistent HTTP (HTTP1.1):**

- server leaves connection open after sending response
- subsequent HTTP messages between same client/server sent over open connection
- client sends requests as soon as it encounters a referenced object
- as little as one RTT for all the referenced objects (cutting response time in half)

Application Layer: 2-26

25

26

# Assignment Project Exam Help

### HTTP request message

- two types of HTTP messages: *request, response*
- **HTTP request message:**
  - ASCII (human-readable format)

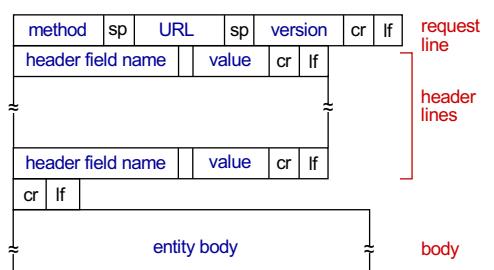

request line (GET, POST, HEAD commands) → carriage return character / line-feed character

carriage return, line feed → ...  
at start of line indicates end of header lines

\* Check out the online interactive exercises for more examples: [http://gaia.cs.umass.edu/kurose\\_ross/interactive/](http://gaia.cs.umass.edu/kurose_ross/interactive/)

Application Layer: 2-27

### HTTP request message: general format

Application Layer: 2-28

27

28

### Other HTTP request messages

**POST method:**

- web page often includes form input
- user input sent from client to server in entity body of HTTP POST request message

**GET method** (for sending data to server):

- include user data in URL field of HTTP GET request message (following a '?'):  
`www.somesite.com/animalsearch?monkeys&banana`

**HEAD method:**

- requests headers (only) that would be returned if specified URL were requested with an HTTP GET method.

**PUT method:**

- uploads new file (object) to server
- completely replaces file that exists at specified URL with content in entity body of POST HTTP request message

# Assignment Project Exam Help

Application Layer: 2-29

29

status line (protocol → `HTTP/1.1 200 OK`)  
status code status phrase

Application Layer: 2-30

30

<https://powcoder.com>

### HTTP response status codes

- status code appears in 1st line in server-to-client response message.
- some sample codes:

**200 OK**

- request succeeded, requested object later in this message

**301 Moved Permanently**

- requested object moved, new location specified later in this message (in Location: field)

**400 Bad Request**

- request msg not understood by server

**404 Not Found**

- requested document not found on this server

**505 HTTP Version Not Supported**

### Add WeChat powcoder

Trying out HTTP (client side) for yourself

1. netcat to your favorite Web server:  

```
% nc -c -v gaia.cs.umass.edu 80
```

  - opens TCP connection to port 80 (default HTTP server port) at gaia.cs.umass.edu.
  - anything typed in will be sent to port 80 at gaia.cs.umass.edu
2. type in a GET HTTP request:  

```
GET /kurose_ross/interactive/index.php HTTP/1.1
Host: gaia.cs.umass.edu
```

  - by typing this in (hit carriage return twice), you send this minimal (but complete) GET request to HTTP server
3. look at response message sent by HTTP server!
 

(or use Wireshark to look at captured HTTP request/response)

Application Layer: 2-31

Application Layer: 2-32

31

32

## Maintaining user/server state: cookies

Recall: HTTP GET/response interaction is **stateless**

- no notion of multi-step exchanges of HTTP messages to complete a Web “transaction”
  - no need for client/server to track “state” of multi-step exchange
  - all HTTP requests are independent of each other
  - no need for client/server to “recover” from a partially-completed-but-never-completely-completed transaction

a stateful protocol: client makes two changes to X, or none at all

Application Layer: 2-33

33

## Maintaining user/server state: cookies

Web sites and client browser use **cookies** to maintain some state between transactions

**four components:**

- cookie header line of HTTP *response* message
- cookie header line in next HTTP *request* message
- cookie file kept on user’s host, managed by user’s browser
- backend database at Web site

**Example:**

- Susan uses browser on laptop, visits specific e-commerce site for first time
- when initial HTTP request arrives at site, site creates:
  - unique ID (aka “cookie”)
  - entry in backend database for ID
- subsequent HTTP requests from Susan to this site will contain cookie ID value, allowing site to “identify” Susan

Application Layer: 2-34

34

Assignment Project Exam Help

<https://powcoder.com>

## Maintaining user/server state: cookies

client

usual HTTP request msg

Amazon server creates ID 1678 for user

usual HTTP response set-cookie: 1678

usual HTTP request msg cookie: 1678

usual HTTP response msg

one week later:

usual HTTP request msg cookie: 1678

usual HTTP response msg

time

time

Application Layer: 2-35

35

## Add WeChat powcoder

### HTTP cookies: comments

**What cookies can be used for:**

- authorization
- shopping carts
- recommendations
- user session state (Web e-mail)

**Challenge: How to keep state?**

- at protocol endpoints:** maintain state at sender/receiver over multiple transactions
- in messages:** cookies in HTTP messages carry state

**cookies and privacy:**

- cookies permit sites to learn a lot about you on their site.
- third party persistent cookies (tracking cookies) allow common identity (cookie value) to be tracked across multiple web sites

aside

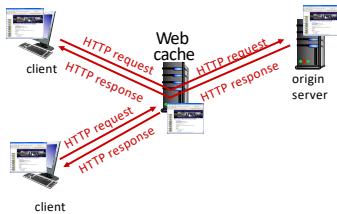

Application Layer: 2-36

36

## Web caches

**Goal:** satisfy client requests without involving origin server

- user configures browser to point to a (local) **Web cache**
- browser sends all HTTP requests to cache
  - if* object in cache: cache returns object to client
  - else* cache requests object from origin server, caches received object, then returns object to client

Application Layer: 2-37

37

## Web caches (aka proxy servers)

**Why** Web caching?

- reduce response time for client request
  - cache is closer to client
- reduce traffic on an institution's access link
- Internet is dense with caches
  - enables "poor" content providers to more effectively deliver content

Cache-Control: max-age=<seconds>  
Cache-Control: no-cache

Application Layer: 2-38

38

# Assignment Project Exam Help

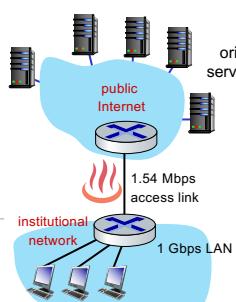

## Caching example

**Scenario:**

- access link rate: 1.54 Mbps
- RTT from institutional router to server: 2 sec
- web object size: 100K bits
- average request rate from browsers to origin servers: 15/sec
  - avg data rate to browsers: 1.50 Mbps

**Performance:**

- access link utilization = .97 *problem: large queueing delays at high utilization!*
- LAN utilization: .0015
- end-end delay = Internet delay + access link delay + LAN delay  
 $= 2 \text{ sec} + \text{minutes} + \text{usecs}$

Application Layer: 2-39

39

## Add WeChat powcoder

### Option 1: buy a faster access link

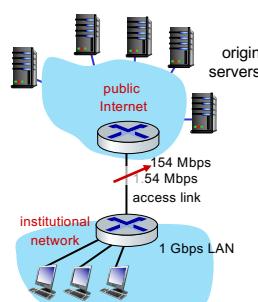

**Scenario:**

- access link rate: 154 Mbps
- RTT from institutional router to server: 2 sec
- web object size: 100K bits
- average request rate from browsers to origin servers: 15/sec
  - avg data rate to browsers: 1.50 Mbps

**Performance:**

- access link utilization = .0097 → .0097
- LAN utilization: .0015
- end-end delay = Internet delay + access link delay + LAN delay  
 $= 2 \text{ sec} + \text{msecs} + \text{usecs}$

**Cost:** faster access link (expensive!)

Application Layer: 2-40

40

**Option 2: install a web cache**

**Scenario:**

- access link rate: 1.54 Mbps
- RTT from institutional router to server: 2 sec
- web object size: 100K bits
- average request rate from browsers to origin servers: 15/sec
  - avg data rate to browsers: 1.50 Mbps

**Cost:** web cache (cheap!)

**Performance:**

- LAN utilization: .?
- access link utilization = ? *How to compute link utilization, delay?*
- average end-end delay = ?

Application Layer: 2-41

41

**Calculating access link utilization, end-end delay with cache:**

suppose cache hit rate is 0.4:

- 40% requests served by cache, with low (msec) delay
- 60% requests satisfied at origin
  - rate to browsers over access link  
=  $0.6 * 1.50 \text{ Mbps} = .9 \text{ Mbps}$
  - access link utilization =  $0.9 / 1.54 = .58$  means low (msec) queueing delay at access link
- average end-end delay:  
 $= 0.6 * (\text{delay from origin servers}) + 0.4 * (\text{delay when satisfied at cache})$   
 $= 0.6(2.01) + 0.4(1 \text{ msec}) = 1.1 \text{ sec}$

*lower average end-end delay than with 154 Mbps link (and cheaper too!)*

Application Layer: 2-42

42

# Assignment Project Exam Help

**Conditional GET**

**Goal:** don't send object if cache has up-to-date cached version
 

- no object transmission delay (or use of network resources)

**client:** specify date of cached copy in HTTP request  
*If-modified-since: <date>*

**server:** response contains no object if cached copy is up-to-date:  
**HTTP/1.0 304 Not Modified**

Application Layer: 2-43

43

**Add WeChat powcoder**

**HTTP/2**

**Key goal:** decreased delay in multi-object HTTP requests

**HTTP1.1:** introduced **multiple, pipelined GETs** over single TCP connection

- server responds *in-order* (FCFS: first-come-first-served scheduling) to GET requests
- with FCFS, small object may have to wait for transmission (**head-of-line (HOL) blocking**) behind large object(s)
- loss recovery (retransmitting lost TCP segments) stalls object transmission

Application Layer: 2-44

44

## HTTP/2

*Key goal:* decreased delay in multi-object HTTP requests

**HTTP/2:** [RFC 7540, 2015] increased flexibility at *server* in sending objects to client:

- methods, status codes, most header fields unchanged from HTTP 1.1
- transmission order of requested objects based on client-specified object priority (not necessarily FCFS)
- *push* unrequested objects to client
- divide objects into frames, schedule frames to mitigate HOL blocking

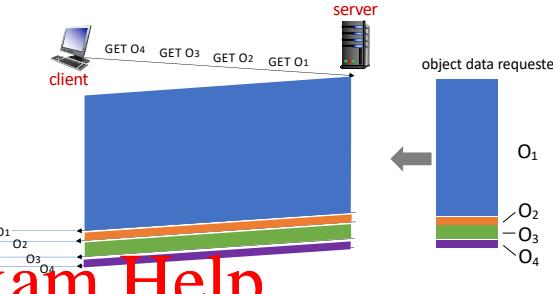

# Assignment Project Exam Help

Application Layer: 2-45

45

## HTTP/2: mitigating HOL blocking

HTTP 1.1: client requests 1 large object (e.g., video file) and 3 smaller objects

objects delivered in order requested: O<sub>2</sub>, O<sub>3</sub>, O<sub>4</sub> wait behind O<sub>1</sub>

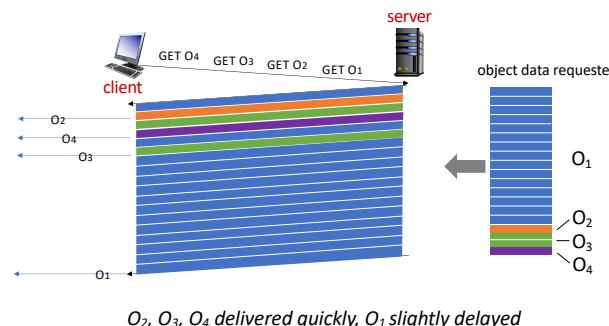

Application Layer: 2-46

46

<https://powcoder.com>

## HTTP/2: mitigating HOL blocking

HTTP/2: objects divided into frames, frame transmission interleaved

Application Layer: 2-47

47

## HTTP/2 to HTTP/3

HTTP/2 over single TCP connection means:

- recovery from packet loss still stalls all object transmissions
  - as in HTTP 1.1, browsers have incentive to open multiple parallel TCP connections to reduce stalling, increase overall throughput
- no security over vanilla TCP connection
- **HTTP/3:** adds security, per object error- and congestion-control (more pipelining) over UDP
  - more on HTTP/3 in transport layer

Application Layer: 2-48

48

## Application layer: overview

- Principles of network applications
- Web and HTTP
- E-mail, SMTP, IMAP
- The Domain Name System DNS

■ P2P applications  
■ video streaming and content distribution networks  
■ socket programming with UDP and TCP

Application Layer: 2-49

49

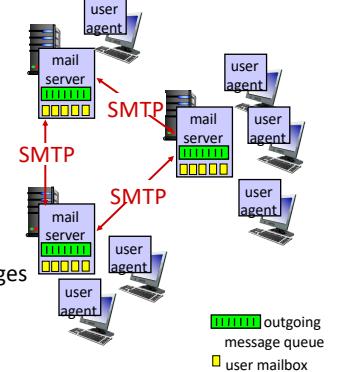

## E-mail

**Three major components:**

- user agents
- mail servers
- simple mail transfer protocol: SMTP

**User Agent**

- a.k.a. "mail reader"
- composing, editing, reading mail messages
- e.g., Outlook, iPhone mail client
- outgoing, incoming messages stored on server

Application Layer: 2-50

50

<https://powcoder.com>

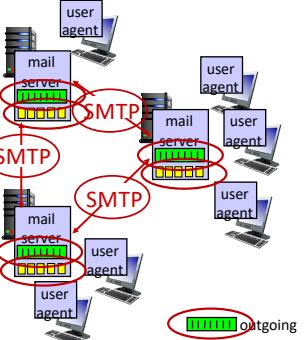

## E-mail: mail servers

**mail servers:**

- **mailbox** contains incoming messages for user
- **message queue** of outgoing (to be sent) mail messages

**SMTP protocol** between mail servers to send email messages

- **client**: sending mail server
- **"server"**: receiving mail server

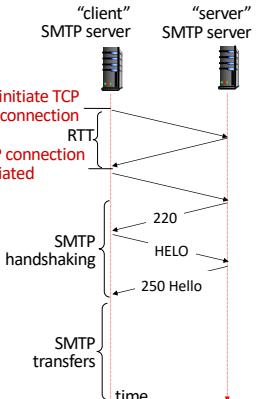

Application Layer: 2-51

51

## Add WeChat powcoder

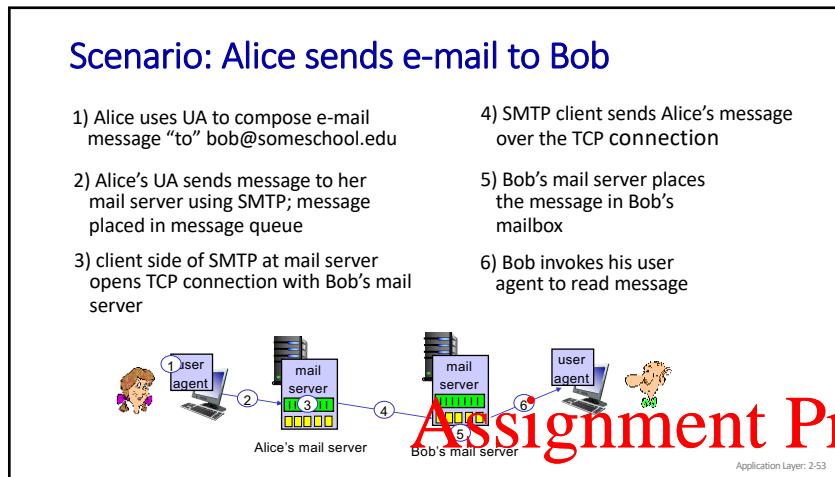

### SMTP RFC (5321)

- uses TCP to reliably transfer email message from client (mail server initiating connection) to server, port 25
  - direct transfer: sending server (acting like client) to receiving server
- three phases of transfer
  - SMTP handshaking (greeting)
  - SMTP transfer of messages
  - SMTP closure
- command/response interaction (like HTTP)
  - commands: ASCII text
  - response: status code and phrase

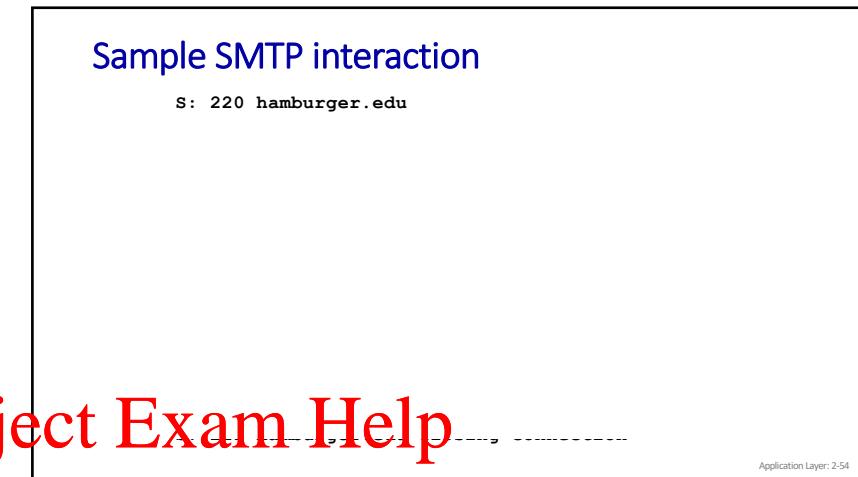

Application Layer: 2-52

52

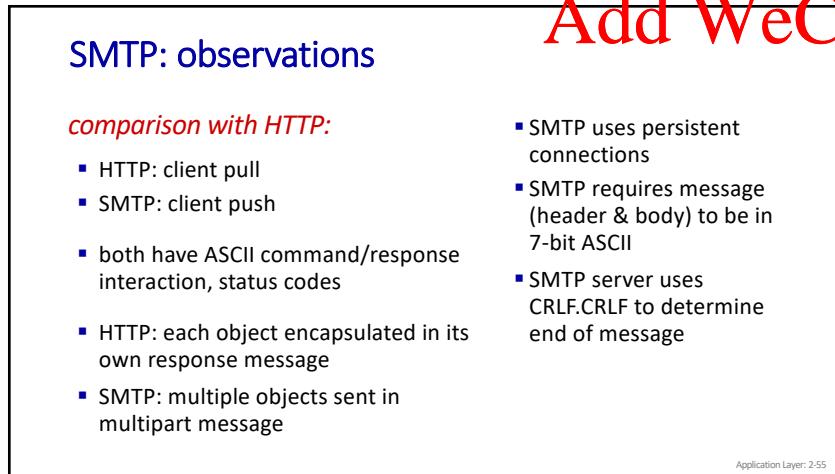

53

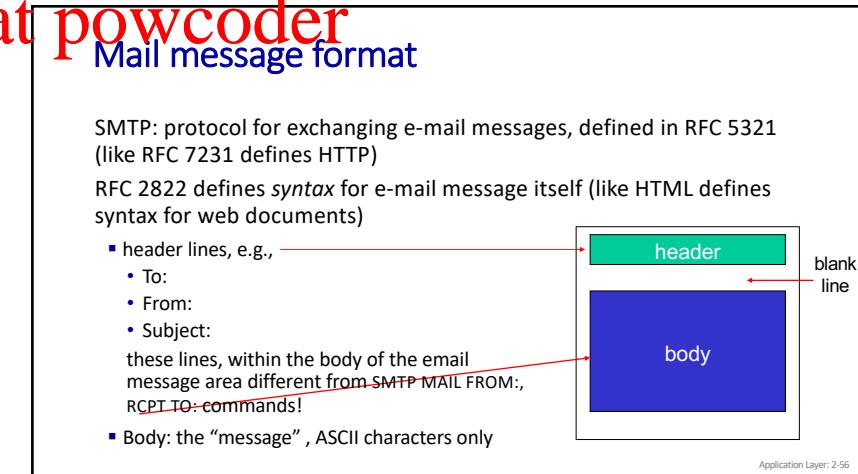

54

<https://powcoder.com>

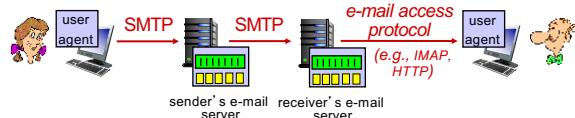

55

56

## Retrieving email: mail access protocols

- **SMTP:** delivery/storage of e-mail messages to receiver's server
- mail access protocol: retrieval from server
  - **IMAP:** Internet Mail Access Protocol [RFC 3501]: messages stored on server, IMAP provides retrieval, deletion, folders of stored messages on server
- **HTTP:** gmail, Hotmail, Yahoo!Mail, etc. provides web-based interface on top of STMP (to send), IMAP (or POP) to retrieve e-mail messages

Application Layer: 2-57

57

## Application Layer: Overview

- Principles of network applications
- Web and HTTP
- E-mail, SMTP, IMAP
- The Domain Name System DNS

Application Layer: 2-58

# Assignment Project Exam Help

58

<https://powcoder.com>

## DNS: Domain Name System

*people:* many identifiers:

- SSN, name, passport #

*Internet hosts, routers:*

- IP address (32 bit) - used for addressing datagrams
- “name”, e.g., cs.umass.edu - used by humans

*Q:* how to map between IP address and name, and vice versa ?

### Domain Name System (DNS):

- **distributed database** implemented in hierarchy of many *name servers*
- **application-layer protocol:** hosts, DNS servers communicate to *resolve* names (address/name translation)
  - *note:* core Internet function, **implemented as application-layer protocol**
  - complexity at network's “edge”

Application Layer: 2-59

59

## Add WeChat powcoder

## DNS: services, structure

### DNS services:

- hostname-to-IP-address translation
- host aliasing
  - canonical, alias names
- mail server aliasing
- load distribution
  - replicated Web servers: many IP addresses correspond to one name

### *Q: Why not centralize DNS?*

- single point of failure
- traffic volume
- distant centralized database
- maintenance

### *A: doesn't scale!*

- Comcast DNS servers alone: 600B DNS queries/day
- Akamai DNS servers alone: 2.2T DNS queries/day

Application Layer: 2-60

60

## Thinking about the DNS

humongous distributed database:

- ~ billion records, each simple

handles many *trillions* of queries/day:

- *many* more reads than writes
- *performance matters*: almost every Internet transaction interacts with DNS - msecs count!

organizationally, physically decentralized:

- millions of different organizations responsible for their records

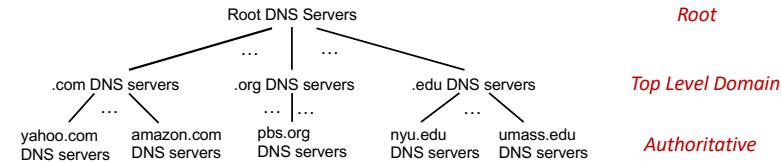

"bulletproof": reliability, security

Application Layer: 2-61

61

## DNS: a distributed, hierarchical database

Client wants IP address for www.amazon.com; 1<sup>st</sup> approximation:

- client queries root server to find .com DNS server
- client queries .com DNS server to get amazon.com DNS server
- client queries amazon.com DNS server to get IP address for www.amazon.com

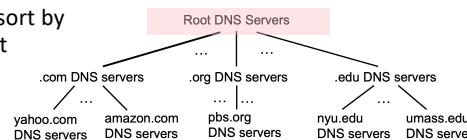

Application Layer: 2-62

62

# Assignment Project Exam Help

## DNS: root name servers

- official, contact-of-last-resort by name servers that can not resolve name

Application Layer: 2-63

63

# Add WeChat powcoder

## DNS: root name servers

- official, contact-of-last-resort by name servers that can not resolve name
- *incredibly important* Internet function
  - Internet couldn't function without it!
  - DNSSEC – provides security (authentication, message integrity)
- ICANN (Internet Corporation for Assigned Names and Numbers) manages root DNS domain

13 logical root name "servers" worldwide each "server" replicated many times (~200 servers in US)

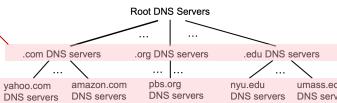

Application Layer: 2-64

64

## Top-Level Domain, and authoritative servers

**Top-Level Domain (TLD) servers:**

- responsible for .com, .org, .net, .edu, .aero, .jobs, .museums, and all top-level country domains, e.g.: .cn, .uk, .fr, .ca, .jp
- Network Solutions: authoritative registry for .com, .net TLD
- Educause: .edu TLD

**authoritative DNS servers:**

- organization's own DNS server(s), providing authoritative hostname to IP mappings for organization's named hosts
- can be maintained by organization or service provider

Application Layer: 2-65

65

## Local DNS name servers

- when host makes DNS query, it is sent to its *local* DNS server
  - Local DNS server returns reply, answering:
    - from its local cache of recent name-to-address translation pairs (possibly out of date!)
    - forwarding request into DNS hierarchy for resolution
  - each ISP has local DNS name server; to find yours:
    - MacOS: % scutil --dns
    - Windows: >ipconfig /all
- local DNS server doesn't strictly belong to hierarchy

Application Layer: 2-66

66

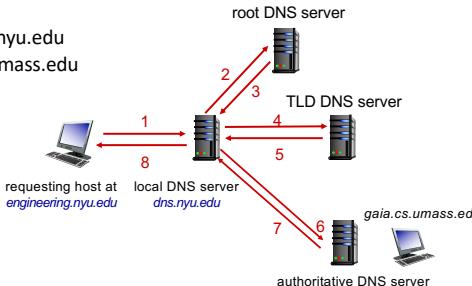

# Assignment Project Exam Help

## DNS name resolution: iterated query

**Example:** host at engineering.nyu.edu wants IP address for gaia.cs.umass.edu

**Iterated query:**

- contacted server replies with name of server to contact
- "I don't know this name, but ask this server"

Application Layer: 2-67

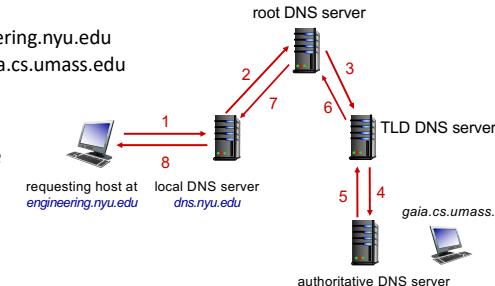

67

## DNS name resolution: recursive query

**Example:** host at engineering.nyu.edu wants IP address for gaia.cs.umass.edu

**Recursive query:**

- puts burden of name resolution on contacted name server
- heavy load at upper levels of hierarchy?

Application Layer: 2-68

68

## Caching DNS Information

- once (any) name server learns mapping, it *caches* mapping, and *immediately* returns a cached mapping in response to a query
  - caching improves response time
  - cache entries timeout (disappear) after some time (TTL)
  - TLD servers typically cached in local name servers
- cached entries may be *out-of-date*
  - if named host changes IP address, may not be known Internet-wide until all TTLs expire!
  - best-effort name-to-address translation!*

Application Layer: 2-69

69

## DNS records

**DNS:** distributed database storing resource records (**RR**)

RR format: (name, value, type, ttl)

**type=A**

- name is hostname
- value is IP address

**type=NS**

- name is domain (e.g., foo.com)
- value is hostname of authoritative name server for this domain

**type=CNAME**

- name is alias name for some “canonical” (the real) name
- www.ibm.com is really severeast.backup2.ibm.com
- value is canonical name

**type=MX**

- value is name of SMTP mail server associated with name

Application Layer: 2-70

# Assignment Project Exam Help

70

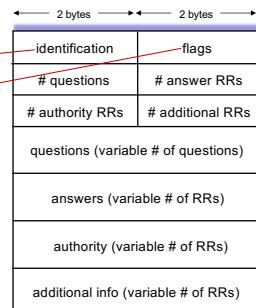

<https://powcoder.com>

## DNS protocol messages

DNS *query* and *reply* messages, both have same *format*:

message header:

- identification:** 16 bit # for query, reply to query uses same #
- flags:**
  - query or reply
  - recursion desired
  - recursion available
  - reply is authoritative

Application Layer: 2-71

71

# Add WeChat powcoder

## DNS protocol messages

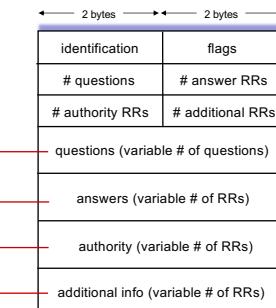

DNS *query* and *reply* messages, both have same *format*:

name, type fields for a query

RRs in response to query

records for authoritative servers

additional “helpful” info that may be used

Application Layer: 2-72

72

## Getting your info into the DNS

example: new startup “Network Utopia”

- register name networkutopia.com at *DNS registrar* (e.g., Network Solutions)
  - provide names, IP addresses of authoritative name server (primary and secondary)
  - registrar inserts NS, A RRs into .com TLD server:  
(networkutopia.com, dns1.networkutopia.com, NS)  
(dns1.networkutopia.com, 212.212.212.1, A)
- create authoritative server locally with IP address 212.212.212.1
  - type A record for www.networkutopia.com
  - type MX record for networkutopia.com

# Assignment Project Exam Help

Application Layer: 2-73

73

## DNS security

### DDoS attacks

- bombard root servers with traffic
  - not successful to date
  - traffic filtering
  - local DNS servers cache IPs of TLD servers, allowing root server bypass
- bombard TLD servers
  - potentially more dangerous

### Spoofing attacks

- intercept DNS queries, returning bogus replies
  - DNS cache poisoning
  - RFC 4033: DNSSEC authentication services

Application Layer: 2-74

74

<https://powcoder.com>

## Application Layer: Overview

- Principles of network applications
- Web and HTTP
- E-mail, SMTP, IMAP
- The Domain Name System  
DNS

- P2P applications
- video streaming and content distribution networks
- socket programming with UDP and TCP

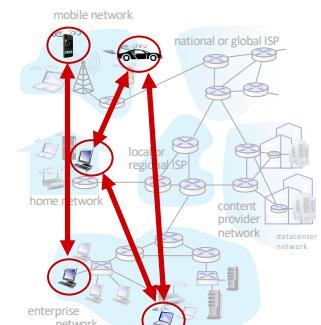

Application Layer: 2-75

75

# Add WeChat powcoder

## Peer-to-peer (P2P) architecture

- *no always-on server*
- arbitrary end systems directly communicate
- peers request service from other peers, provide service in return to other peers
  - *self scalability* – new peers bring new service capacity, and new service demands
- peers are intermittently connected and change IP addresses
  - complex management
- examples: P2P file sharing (BitTorrent), streaming (KanKan), VoIP (Skype)

Application Layer: 2-76

76

### File distribution: client-server vs P2P

**Q:** how much time to distribute file (size  $F$ ) from one server to  $N$  peers?

- peer upload/download capacity is limited resource

Introduction: 1-77

77

### File distribution time: client-server

- server transmission:** must sequentially send (upload)  $N$  file copies:
  - time to send one copy:  $F/u_s$
  - time to send  $N$  copies:  $NF/u_s$
- client:** each client must download file copy
  - $d_{min}$  = min client download rate
  - min client download time:  $F/d_{min}$

*time to distribute  $F$  to  $N$  clients using client-server approach*  
 $D_{CS} \geq \max\{NF/u_s, F/d_{min}\}$   
increased linearly in  $N$

Introduction: 1-78

78

Assignment Project Exam Help  
<https://powcoder.com>

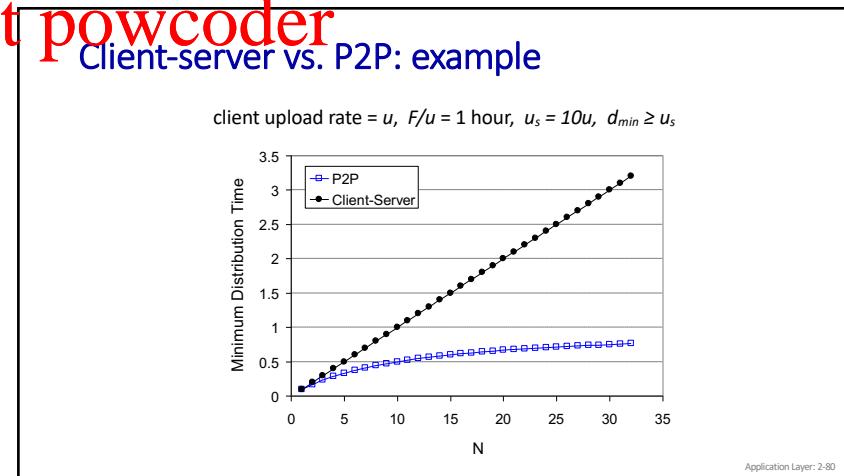

### File distribution time: P2P

- server transmission:** must upload at least one copy:
  - time to send one copy:  $F/u_s$
- client:** each client must download file copy
  - min client download time:  $F/d_{min}$
- clients:** as aggregate must download  $NF$  bits
  - max upload rate (limiting max download rate) is  $u_s + \sum u_i$

*time to distribute  $F$  to  $N$  clients using P2P approach*  
 $D_{P2P} \geq \max\{F/u_s, F/d_{min}, NF/(u_s + \sum u_i)\}$   
increases linearly in  $N$  ...  
... but so does this, as each peer brings service capacity

Application Layer: 2-79

79

80

**P2P file distribution: BitTorrent**

- file divided into 256Kb chunks
- peers in torrent send/receive file chunks

**tracker:** tracks peers participating in torrent      **torrent:** group of peers exchanging chunks of a file

Alice arrives ...  
... obtains list of peers from tracker  
... and begins exchanging file chunks with peers in torrent

Application Layer: 2-81

**P2P file distribution: BitTorrent**

- peer joining torrent:
  - has no chunks, but will accumulate them over time from other peers
  - registers with tracker to get list of peers, connects to subset of peers ("neighbors")
- while downloading, peer uploads chunks to other peers
- peer may change peers with whom it exchanges chunks
- **churn:** peers may come and go
- once peer has entire file, it may (selfishly) leave or (altruistically) remain in torrent

Application Layer: 2-82

81

82

# Assignment Project Exam Help

**BitTorrent: requesting, sending file chunks**

**Requesting chunks:**

- at any given time, different peers have different subsets of file chunks
- periodically, Alice asks each peer for list of chunks that they have
- Alice requests missing chunks from peers, rarest first

**Sending chunks: tit-for-tat**

- Alice sends chunks to those four peers currently sending her chunks *at highest rate*
  - other peers are choked by Alice (do not receive chunks from her)
  - re-evaluate top 4 every10 secs
- every 30 secs: randomly select another peer, starts sending chunks
  - "optimistically unchoke" this peer
  - newly chosen peer may join top 4

Application Layer: 2-83

**BitTorrent: tit-for-tat**

(1) Alice "optimistically unchokes" Bob  
 (2) Alice becomes one of Bob's top-four providers; Bob reciprocates  
 (3) Bob becomes one of Alice's top-four providers

higher upload rate: find better trading partners, get file faster!

Application Layer: 2-84

83

84

### Application layer: overview

- Principles of network applications
- Web and HTTP
- E-mail, SMTP, IMAP
- The Domain Name System DNS

Application Layer: 2-85

### Video Streaming and CDNs: context

- P2P applications
- video streaming and content distribution networks
- socket programming with UDP and TCP

Application Layer: 2-86

85

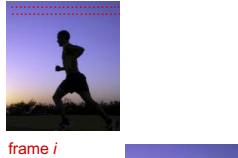

86

Assignment Project Exam Help

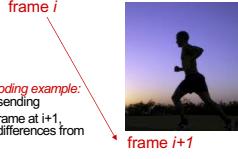

### Multimedia: video

- video: sequence of images displayed at constant rate
  - e.g., 24 images/sec
- digital image: array of pixels
  - each pixel represented by bits
- coding: use redundancy *within* and *between* images to decrease # bits used to encode image
  - spatial (within image)
  - temporal (from one image to next)

*spatial coding example:* instead of sending  $N$  values of same color (all purple), send only two values: color value (purple) and number of repeated values ( $N$ )

*temporal coding example:* instead of sending complete frame at  $i+1$ , send only differences from frame  $i$

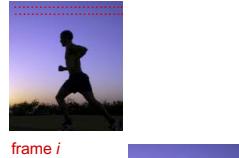

Application Layer: 2-87

### Add WeChat powcoder

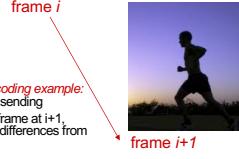

### Multimedia: video

- **CBR: (constant bit rate):** video encoding rate fixed
- **VBR: (variable bit rate):** video encoding rate changes as amount of spatial, temporal coding changes
- **examples:**
  - MPEG 1 (CD-ROM) 1.5 Mbps
  - MPEG2 (DVD) 3-6 Mbps
  - MPEG4 (often used in Internet, 64Kbps – 12 Mbps)

*spatial coding example:* instead of sending  $N$  values of same color (all purple), send only two values: color value (purple) and number of repeated values ( $N$ )

*temporal coding example:* instead of sending complete frame at  $i+1$ , send only differences from frame  $i$

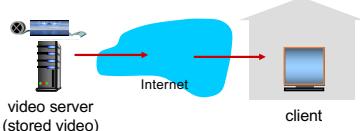

Application Layer: 2-88

87

88

**Streaming stored video**

simple scenario:

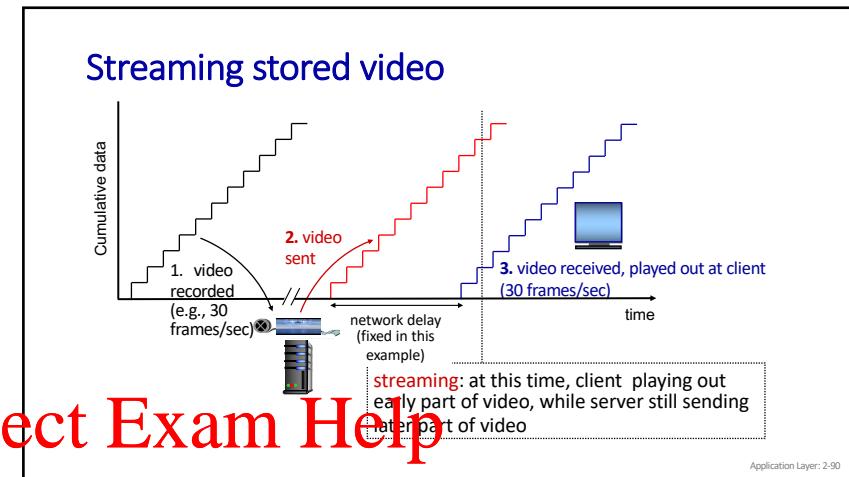

video server (stored video)

client

Main challenges:

- server-to-client bandwidth will *vary* over time, with changing network congestion levels (in house, access network, network core, video server)
- packet loss, delay due to congestion will delay playback or result in poor video quality

Application Layer: 2-89

89

90

# Assignment Project Exam Help

**Add WeChat powcoder**

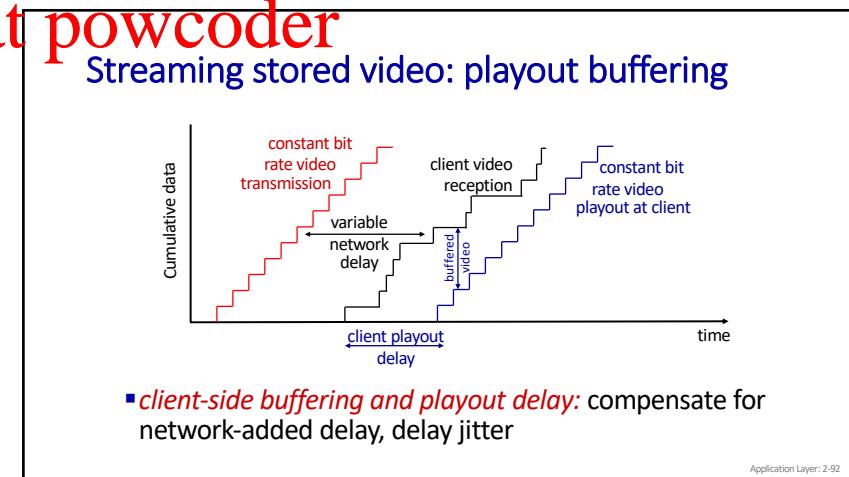

**Streaming stored video: challenges**

- continuous playout constraint:** during client video playout, playout timing must match original timing
  - ... but *network delays are variable* (jitter), so will need *client-side buffer* to match continuous playout constraint
- other challenges:**
  - client interactivity: pause, fast-forward, rewind, jump through video
  - video packets may be lost, retransmitted

Application Layer: 2-91

91

92

**Streaming multimedia: DASH**

**Dynamic, Adaptive Streaming over HTTP**

**server:**

- divides video file into multiple chunks
- each chunk encoded at multiple different rates
- different rate encodings stored in different files
- files replicated in various CDN nodes
- manifest file:** provides URLs for different chunks

**client:**

- periodically estimates server-to-client bandwidth
- consulting manifest, requests one chunk at a time
  - chooses maximum coding rate sustainable given current bandwidth
  - can choose different coding rates at different points in time (depending on available bandwidth at time), and from different servers

Application Layer: 2-93

93

**Streaming multimedia: DASH**

▪ **"intelligence"** at client: client determines

- when** to request chunk (so that buffer starvation, or overflow does not occur)
- what encoding rate** to request (higher quality when more bandwidth available)
- where** to request chunk (can request from URL server that is "close" to client or has high available bandwidth)

**Streaming video = encoding + DASH + playout buffering**

Application Layer: 2-94

94

Assignment Project Exam Help

<https://powcoder.com>

**Content distribution networks (CDNs)**

**challenge:** how to stream content (selected from millions of videos) to hundreds of thousands of *simultaneous* users?

▪ **option 1:** single, large "mega-server"
 

- single point of failure
- point of network congestion
- long (and possibly congested) path to distant clients

....quite simply: this solution **doesn't scale**

Application Layer: 2-95

95

**Content distribution networks (CDNs)**

**challenge:** how to stream content (selected from millions of videos) to hundreds of thousands of *simultaneous* users?

▪ **option 2:** store/serve multiple copies of videos at multiple geographically distributed sites (**CDN**)
 

- enter deep:** push CDN servers deep into many access networks
  - close to users
  - Akamai: 240,000 servers deployed in > 120 countries (2015)
- bring home:** smaller number (10's) of larger clusters in POPs near access nets
  - used by Limelight

**Akamai**  
**Limelight** NETWORKS

Application Layer: 2-96

96

**Content distribution networks (CDNs)**

- CDN: stores copies of content (e.g. MADMEN) at CDN nodes
- subscriber requests content, service provider returns manifest
  - using manifest, client retrieves content at highest supportable rate
  - may choose different rate or copy if network path congested

97

**Content distribution networks (CDNs)**

*OTT: “over the top”*

Internet host-host communication as a service

*OTT challenges:* coping with a congested Internet from the “edge”  
what content to place in which CDN node?  
from which CDN node to retrieve content? At which rate?

98

<https://powcoder.com>

**Application Layer: Overview**

- Principles of network applications
- Web and HTTP
- E-mail, SMTP, IMAP
- The Domain Name System DNS
- P2P applications
- video streaming and content distribution networks
- socket programming with UDP and TCP

99

**Add WeChat powcoder**

**Socket programming**

*goal:* learn how to build client/server applications that communicate using sockets

*socket:* door between application process and end-end-transport protocol

100

## Socket programming

Two socket types for two transport services:

- **UDP**: unreliable datagram
- **TCP**: reliable, byte stream-oriented

**Application Example:**

1. client reads a line of characters (data) from its keyboard and sends data to server
2. server receives the data and converts characters to uppercase
3. server sends modified data to client
4. client receives modified data and displays line on its screen

## Socket programming with UDP

**UDP**: no “connection” between client and server:

- no handshaking before sending data
- sender explicitly attaches IP destination address and port # to each packet
- receiver extracts sender IP address and port# from received packet

**UDP**: transmitted data may be lost or received out-of-order

**Application viewpoint:**

- UDP provides unreliable transfer of groups of bytes (“datagrams”) between client and server processes

# Assignment Project Exam Help

Application Layer: 2-101      Application Layer: 2-102

101

102

<https://powcoder.com>

## Client/server socket interaction: UDP

```

graph TD
    subgraph Server [server (running on serverIP)]
        S1[create socket, port=x:  
serverSocket =  
socket(AF_INET,SOCK_DGRAM)]
        S2[read datagram from  
serverSocket]
        S3[write reply to  
serverSocket  
specifying  
client address,  
port number]
    end
    subgraph Client [client]
        C1[create socket:  
clientSocket =  
socket(AF_INET,SOCK_DGRAM)]
        C2[Create datagram with serverIP address  
And port=x; send datagram via  
clientSocket]
        C3[read datogram from  
clientSocket]
        C4[close  
clientSocket]
    end
    S2 --> C2
    S3 --> C3

```

## Example app: UDP client

**Python UDPClient**

```

include Python's socket library → from socket import *
serverName = 'hostname'
serverPort = 12000
create UDP socket for server → clientSocket = socket(AF_INET,
                                                       SOCK_DGRAM)
get user keyboard input → message = raw_input('Input lowercase sentence:')
attach server name, port to message; send into socket → clientSocket.sendto(message.encode(),
                                                                           (serverName, serverPort))
read reply characters from socket into string → modifiedMessage, serverAddress =
                                                clientSocket.recvfrom(2048)
print out received string and close socket → print modifiedMessage.decode()
                                                clientSocket.close()

```

Application Layer: 2-103      Application Layer: 2-104

103

104

## Example app: UDP server

### Python UDPServer

```

from socket import *
serverPort = 12000

create UDP socket → serverSocket = socket(AF_INET, SOCK_DGRAM)
bind socket to local port number 12000 → serverSocket.bind(("", serverPort))
print ("The server is ready to receive")

loop forever → while True:
Read from UDP socket into message, getting → message, clientAddress = serverSocket.recvfrom(2048)
client's address (client IP and port) → modifiedMessage = message.decode().upper()
send upper case string back to this client → serverSocket.sendto(modifiedMessage.encode(),
clientAddress)

```

Application Layer: 2-105

105

## Socket programming with TCP

### Client must contact server

- server process must first be running
- server must have created socket (door) that welcomes client's contact

### Client contacts server by:

- Creating TCP socket, specifying IP address, port number of server process
- when client creates socket:** client TCP establishes connection to server TCP

#### Application viewpoint

TCP provides reliable, in-order byte-stream transfer ("pipe") between client and server processes

Application Layer: 2-106

106

# Assignment Project Exam Help

## Client/server socket interaction: TCP

```

server (running on hostid)           client

create socket,
port=x, for incoming
request: → serverSocket = socket()
TCP → connection setup
wait for incoming
connection request → connectionSocket = serverSocket.accept()
create socket,
connect to hostid, port=x → clientSocket = socket()
send request using
clientSocket
read request from
connectionSocket
write reply to
connectionSocket
close
connectionSocket
No need to attach server name, port →
clientSocket.connect((serverName,serverPort))
sentence = raw_input('Input lowercase sentence.')
clientSocket.send(sentence.encode())
modifiedSentence = clientSocket.recv(1024)
print ('From Server:', modifiedSentence.decode())
clientSocket.close()

```

Application Layer: 2-107

107

## Example app: TCP client

### Python TCPClient

```

from socket import *
serverName = 'servername'
serverPort = 12000
create TCP socket for server,
remote port 12000 → clientSocket = socket(AF_INET,SOCK_STREAM)
clientSocket.connect((serverName,serverPort))
sentence = raw_input('Input lowercase sentence.')
clientSocket.send(sentence.encode())
modifiedSentence = clientSocket.recv(1024)
print ('From Server:', modifiedSentence.decode())
clientSocket.close()

```

Application Layer: 2-108

108

## Example app: TCP server

```
Python TCPServer
from socket import *
serverPort = 12000
serverSocket = socket(AF_INET,SOCK_STREAM)
serverSocket.bind(("",serverPort))
serverSocket.listen(1)
print 'The server is ready to receive'
while True:
    connectionSocket, addr = serverSocket.accept()
    sentence = connectionSocket.recv(1024).decode()
    capitalizedSentence = sentence.upper()
    connectionSocket.send(capitalizedSentence.encode())
connectionSocket.close()

create TCP welcoming socket → from socket import *
server begins listening for incoming TCP requests → serverPort = 12000
loop forever → serverSocket = socket(AF_INET,SOCK_STREAM)
server waits on accept() for incoming requests, new socket created on return → serverSocket.bind(("",serverPort))
read bytes from socket (but not address as in UDP) → serverSocket.listen(1)
close connection to this client (but not welcoming socket) → print 'The server is ready to receive'
→ while True:
→     connectionSocket, addr = serverSocket.accept()
→     sentence = connectionSocket.recv(1024).decode()
→     capitalizedSentence = sentence.upper()
→     connectionSocket.send(capitalizedSentence.
→                           encode())
→     connectionSocket.close()
```

Application Layer: 2-109

109

## Chapter 2: Summary

our study of network application layer is now complete!

- application architectures
  - client-server
  - P2P
- application service requirements:
  - reliability, bandwidth, delay
- Internet transport service model
  - connection-oriented, reliable: TCP
  - unreliable, datagrams: UDP
- specific protocols:
  - HTTP
  - SMTP, IMAP
  - DNS
  - P2P: BitTorrent
- video streaming, CDNs
- socket programming:
  - TCP, UDP sockets

Application Layer: 2-110

110

# Assignment Project Exam Help

## Chapter 2: Summary

Most importantly: learned about *protocols*!

- typical request/reply message exchange:
  - client requests info or service
  - server responds with data, status code
- message formats:
  - *headers*: fields giving info about data
  - *data*: info(payload) being communicated

# Add WeChat powcoder

- important themes:**
- centralized vs. decentralized
  - stateless vs. stateful
  - scalability
  - reliable vs. unreliable message transfer
  - “complexity at network edge”

Application Layer: 2-111

111

## Additional Chapter 2 slides

Application Layer: 2-112

112

### Sample SMTP interaction

```

S: 220 hamburger.edu
C: HELO crepes.fr
S: 250 Hello crepes.fr, pleased to meet you
C: MAIL FROM: <alice@crepes.fr>
S: 250 alice@crepes.fr... Sender ok
C: RCPT TO: <bob@hamburger.edu>
S: 250 bob@hamburger.edu ... Recipient ok
C: DATA
S: 354 Enter mail, end with "." on a line by itself
C: Do you like ketchup?
C: How about pickles?
C: .
S: 250 Message accepted for delivery
C: QUIT
S: 221 hamburger.edu closing connection

```
